- Derwent Abstract: (FR2774906A) Novelty - A system for the encapsulation of an organic core, containing at least one active material with a mineral shell of aluminum hydroxy carbonate, the cohesion between these two being through a non-ionic surfactant (I) having a hydrophobic segment and a hydrophilic segment.
Detailed Description - The surfactant (I) is preferably one of the following: polyalkoxylated fatty alcohols, polyoxyalkylemated alkyl phenols, polyvinyl alcohols and alkyl ethers, and block copolymers. Preferably they are polyalkoxylated alcohols, tristyryl phenols, and block copolymers, especially those having a hydrophile/ lipophile balance above 6. The final products preferably contain 1 - 3% of surfactant, calculated on the weight of organic compounds. The active material may have cosmetic, pharmaceutical, or phytosanitary applications, and may be incorporated into the core material in its normal form or as an aqueous emulsion or dispersion, especially as an emulsion containing up to 70% water with the active material dissolved in a silicone oil. Such emulsions and dispersions also contain a surfactant, which may be anionic, nonionic, or amphoteric, or zwitterionic. The mineral shell containing aluminum hydroxy carbonate may further contain a metal oxide or a precursor of this, typically oxides and their precursors of Si, Ti, Zr, Zn, Mg, Yt, Ce, and their mixtures. The particles preferably have a size in the range 0.1 - 10 micro m.
Use - The active materials may be used in the cosmetic, phytosanitary and pharmaceutical industries.

BEST AVAILABLE COPY

Advantage - The aluminum hydroxy carbonate coating gives very good protection for the active material, together with good release of the active material through diffusion or dissolution, following a change of pH.
